

Diagram illustrating the structure of a bird's wing, showing the primary feathers and the wing's shape during flight.

The diagram shows the wing's profile, highlighting the primary feathers and the wing's curvature, which is essential for generating lift and thrust during flight.

The wing's shape is adapted for flight, with the primary feathers providing the main surface area for air to flow over, creating lift and thrust.

WING STRUCTURE

The wing is composed of several parts, including the primary feathers, secondary feathers, and the wing membrane, which together form the wing's surface.

The primary feathers are the longest and most prominent feathers on the wing, extending from the wingtip towards the body. They are responsible for generating lift and thrust during flight.

The secondary feathers are located closer to the body and are shorter than the primary feathers. They also contribute to the wing's surface area and are involved in flight control.
